Backend Engineer Challenge

1. Parse **Top 10** Holdings, Country Weights and Sector Weights, ETF name and fund description information for all requested **SPDR ETFs (**www.spdrs.com**)** and store them in a database. The information should be updated daily.
2. Create API using an authentication method of your choice. However, **non expirable keys are not acceptable**. Endpoints should include:
   a. Login authentication for API access
   b. List of available ETF symbol
   c. Get data for ETF by ticker

Assignment details and clarification

- Sample State Street ETF page: https://www.spdrs.com/product/fund.seam?ticker=SPY (top holdings are located under Holdings tab)
- Provide a **Postman** file for API documentation

Technology:

- Programming language: **PHP** / **NodeJS** / **GoLang**
- Database: **MySQL** is preferred but not required
- Use of **HTML** parsing libraries and frameworks is allowed

Code for this assignment needs to be shared on **GitHub** and a working version of the API must be accessible globally.

Hint: Network tab is your friend
